

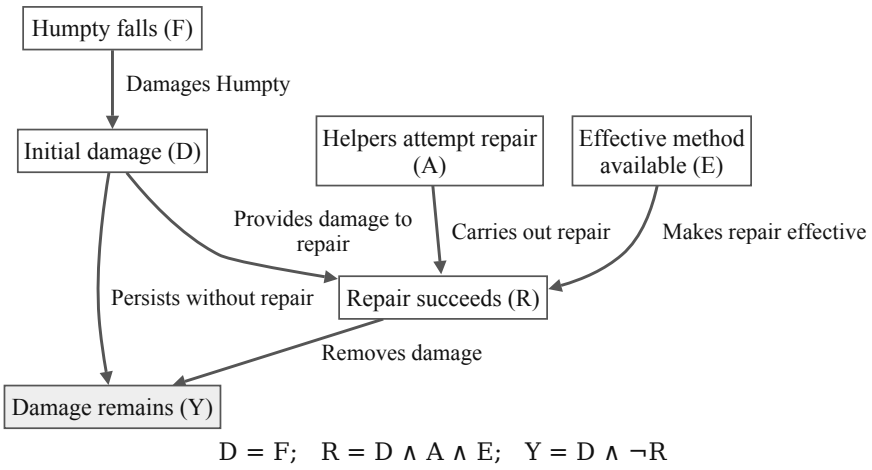

Fig. 1. Humpty Dumpty: repair attempt, effective repair and remaining damage. Author reference model for the controlled adaptation. Damage is removed only when an attempt and an effective method accompany initial damage; failed help does not establish universal irreparability. The displayed rules were added by the experiment author (sentences S4–S6), with independently settable fall, attempt and method inputs (S7). In the factual setting $F = A = 1$, $E = 0$, so $R = 0$ and $Y = 1$. Setting $E = 1$ permits repair, but jointly setting $A = 0$ leaves damage. These specified counterfactuals are not established by the traditional tale.

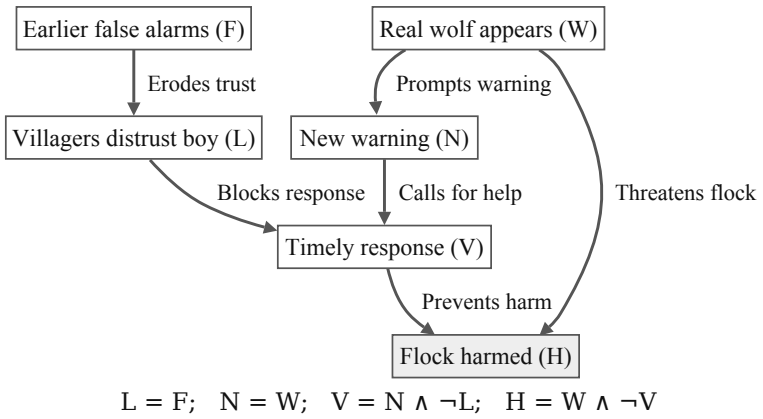

Fig. 2. The Boy Who Cried Wolf: credibility and warning are distinct requirements for timely help. Author reference model for the controlled adaptation. A warning is issued in the factual episode, but distrust blocks response. Under the added rules (S3–S6), removing earlier false alarms prevents harm only if the later warning is still given. Harm therefore returns under the joint intervention $\mathrm{do}(F = 0, N = 0)$. Timely help is assumed to prevent harm completely within this adaptation; the natural retelling does not establish that guarantee. All factual inputs are one, with $V = 0$ and $H = 1$.

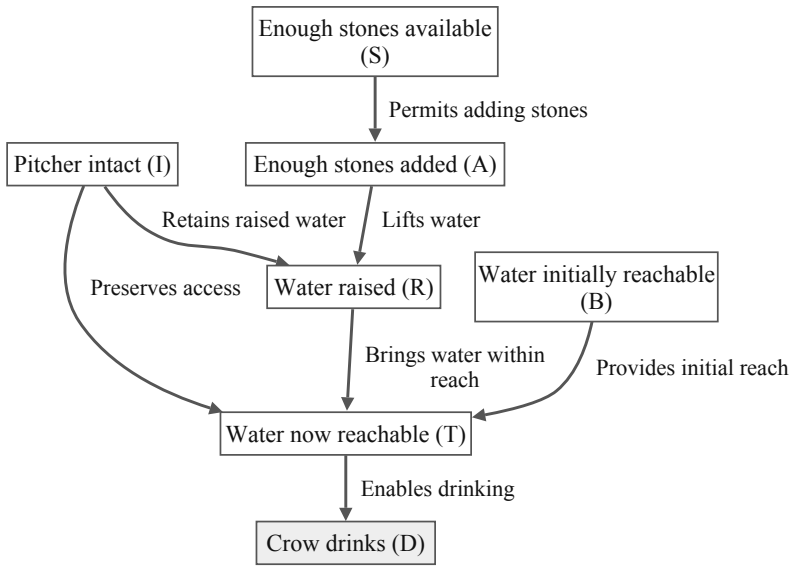

Fig. 3. The Crow and the Pitcher: raising water and already being able to reach it are alternative routes to drinking. Author reference model for the controlled adaptation. The added rules (S3–S6) require an intact pitcher for retained access, but do not make stones universally necessary: do($A = 0, B = 1$) still yields drinking. Sufficient water and readiness to drink are fixed background conditions. Factually $I = S = 1$, $B = 0$; adding enough stones raises the water and makes it reachable. The equations specify a controlled Boolean scenario, not a claim that the traditional tale determines every counterfactual.

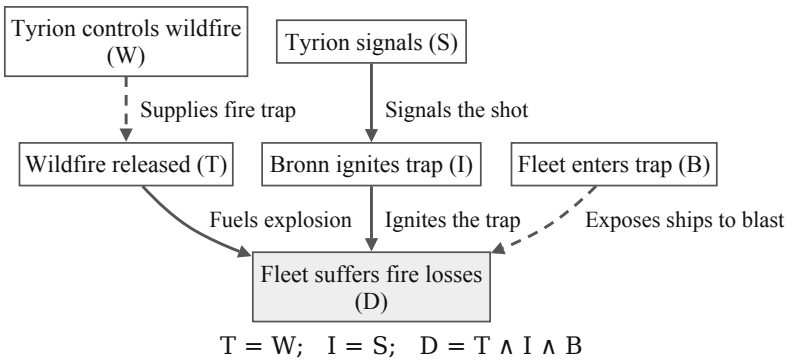

Fig. 4. Blackwater: fuel, ignition and exposed ships converge on severe fleet fire losses. Codex-assisted narrative hypothesis from television evidence, with unchanged v4 scenario functions. The local view distinguishes Tyrion's control of wildfire from its deployment and his signal from Bronn's ignition; it does not by itself explain the whole battle's winner. Solid arrows denote explicit directional evidence in the retained assistant audit, dashed arrows contextual interpretation. The conjunction and the deployment/response rules are modeling assumptions, not functions identified by the passages. Evidence: S02E05 scene 15; S02E09 scenes 12, 14–16 and 19 in the source register. Independent researcher adjudication remains pending.

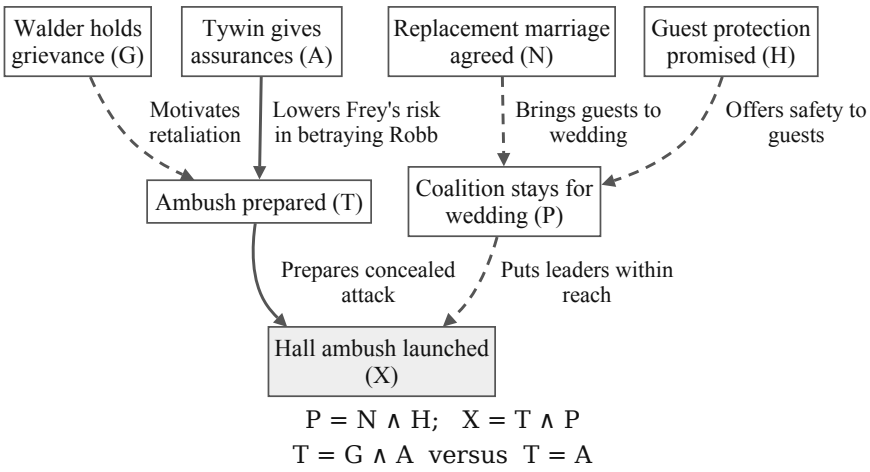

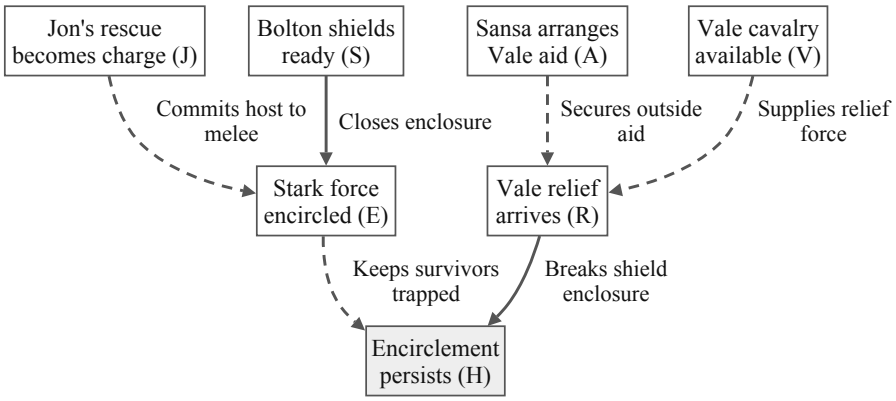

Fig. 5. The Red Wedding: prepared attackers and present leaders converge on the hall ambush. Codex-assisted narrative hypothesis, with unchanged v4 functions. Tywin's assurances are interpreted as reducing *Frey's perceived risk in betraying Robb*, not reducing the danger that Robb will be betrayed. Two assumed plot mechanisms differ on whether Walder's grievance is necessary; the guest-attendance conjunction is also an assumption. This view ends at the hall attack, not the destruction of the entire coalition. Solid/dashed arrows distinguish explicit/contextual directional support in the assistant audit. Evidence: S03E06 scene 9; S03E09 scenes 1, 16–17; S03E10 scene 4 (a retrospective report). Independent researcher adjudication remains pending.

(a) Encirclement and relief

$$E = J \wedge S; \quad R = A \wedge V; \quad H = E \wedge \neg R$$

(b) Starks take Winterfell?

	Relief required	Untrapped advance
No Vale relief	No	No
No Rickon bait	Yes	Yes
Neither bait nor relief	No	Yes

Fig. 6. The Bolton campaign: relief can break an enclosure, yet its necessity for victory depends on the advance mechanism. Codex-assisted narrative hypothesis with unchanged v4 functions. (a) The encirclement mechanism; $H = 0$ factually because timely relief arrives. Solid/dashed arrows denote explicit/contextual directional support. (b) Winterfell capture under the full archived model, not just the displayed local slice. With field force G, pursuit P and breaching capability W, both alternatives use $K = P \wedge W$ and $Y = K \wedge P$. "Relief required" uses $P = G \wedge R \wedge \neg H$; "untrapped advance" uses $P = G \wedge \neg H$. The joint removal of Rickon bait and relief distinguishes them. These are conditional scenarios; the evidence-only partial family leaves all three answers unresolved. Evidence: S06E05 scene 2, S06E09 scenes 9–10 and retrospective S06E10 scene 55. Independent adjudication remains pending.

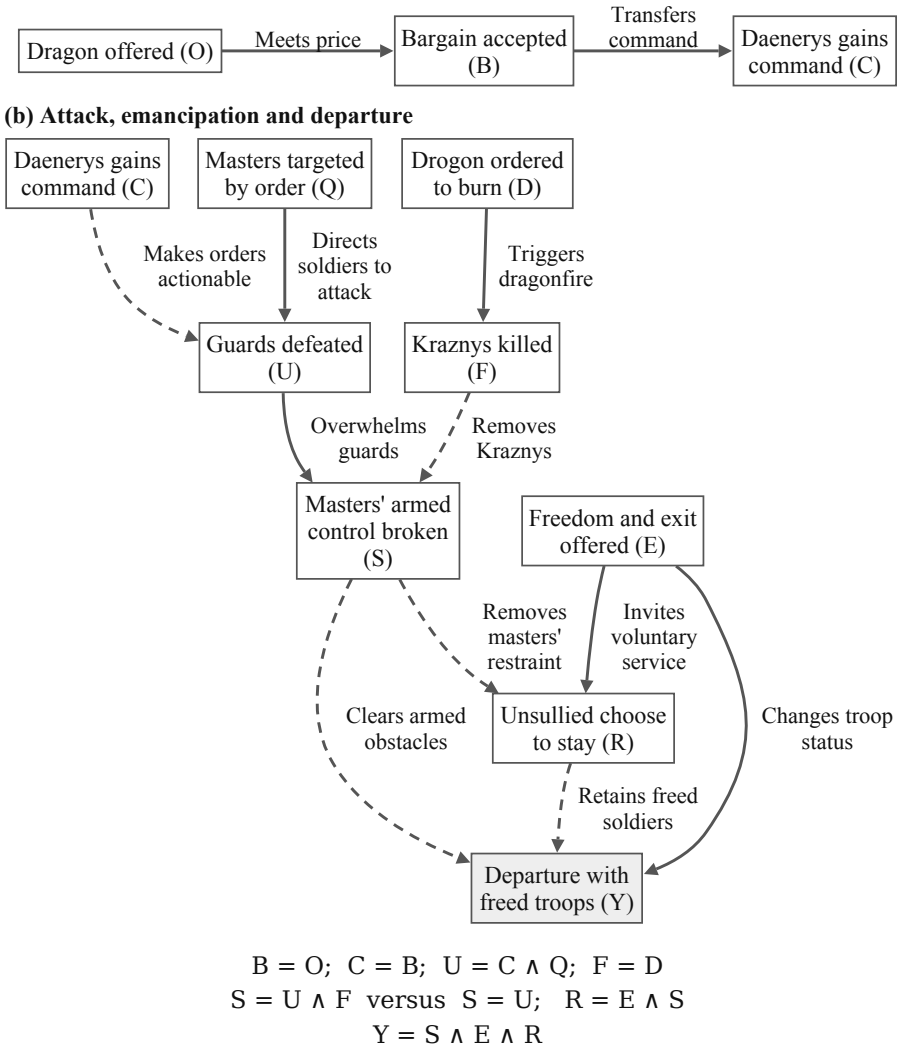

Fig. 7. Astapor: command transfer, armed victory and the choice to remain are distinct steps toward departure with freed troops. Codex-assisted narrative hypothesis with unchanged v4 scenario functions. (a) Acquisition of command; (b) attack, emancipation and departure. Repeated *C* denotes the same variable in both panels. All 12 dependencies are retained. The alternatives differ on whether killing Kraznys is necessary to break the masters' immediate armed control (*S*); the remaining displayed rules also add assumptions. Solid/dashed arrows distinguish explicit/contextual directional support in the assistant audit. The outcome is immediate departure, not durable governance of Astapor. Evidence: S03E03 scene 16 and S03E04 scenes 23–25. Independent researcher adjudication remains pending.
